9. Demo
10. Reference

Introduction

Since a long time, hospitals have played a key role in all our lives. With advancement in technology and the on going pandemic, hospitals sizes have been growing constantly.

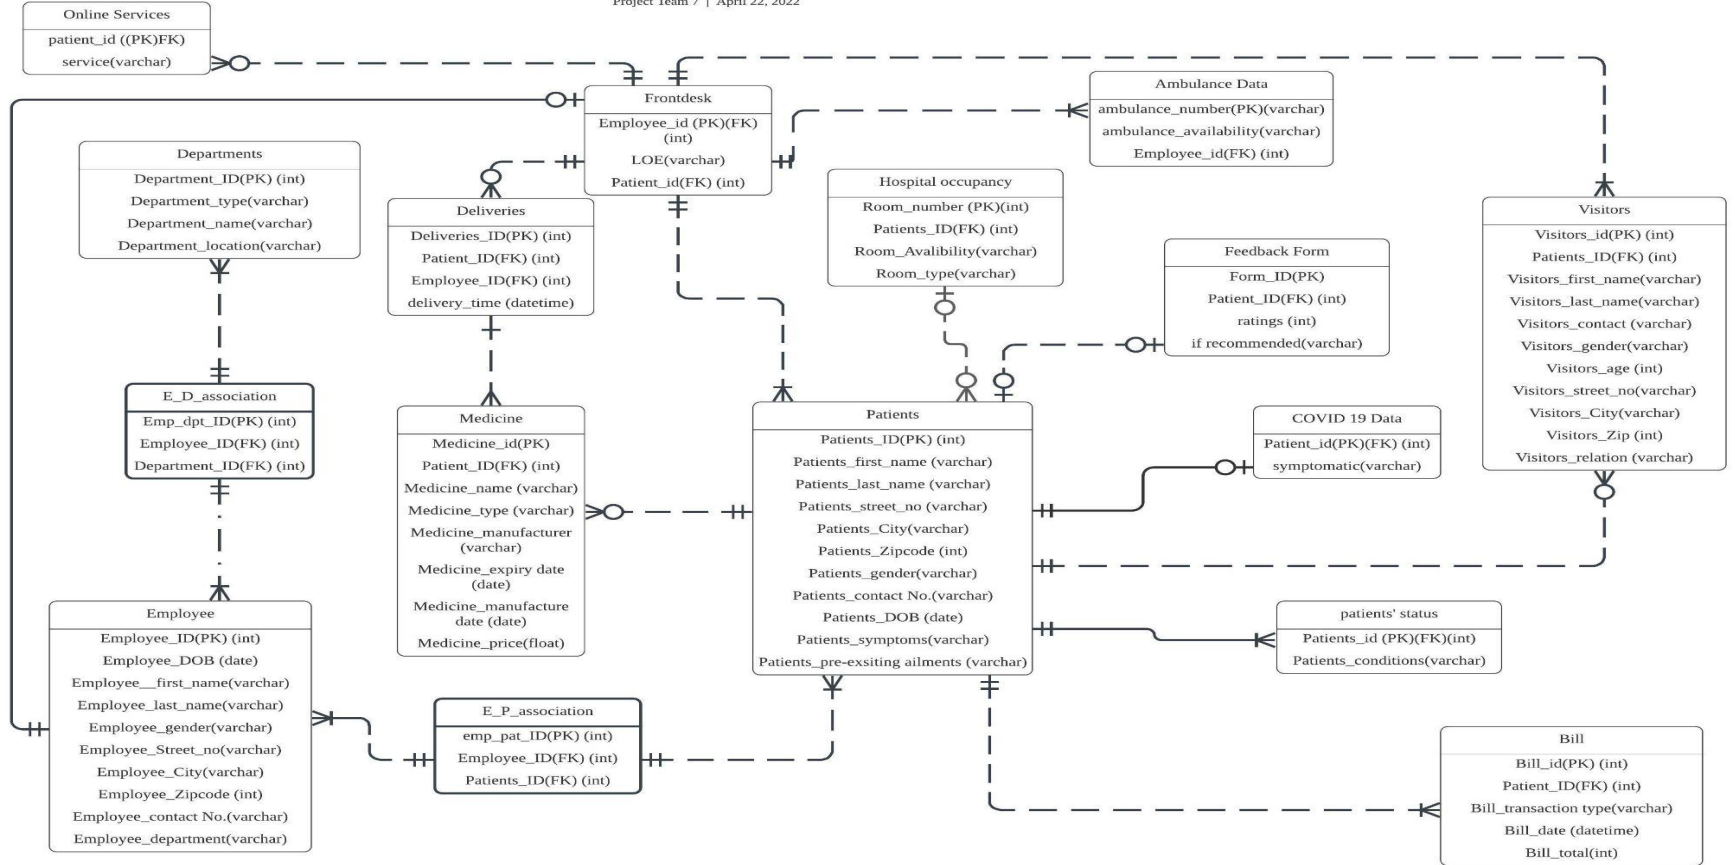

Our topic is creation and maintenance of hospital database and we have carefully read and analysed the business rules to create our final Entity Relationship Diagram.

This database can be used by the administrative staff of hospitals and data of all the day to day activities can be stored in a database which can be further used for analysis by hospital authorities to make decisions.

ER-DIAGRAM

HOSPITAL MANAGEMENT SYSTEM DATABASE

Project Team 7 | April 22, 2022

ER-DIAGRAM ENTITIES

There are 14 entities in total and 2 connecting entities which contain data about the keys for the connecting tables.

- Online Services
- Front Desk
- Departments
- Deliveries
- Medicine
- Employee
- Hospital Occupancy
- Patients
- Ambulance Data
- Covid Data
- Feedback Form
- Patient Status
- Visitors
- Bill
- E_D_ASSOCIATION - Employee Department Association
- E_P_ASSOCIATION - Employee Patient Association

DATA CREATION

Hospital Management System Database

Table Creation

```
● CREATE TABLE Medicine
(
    Medicine_id int not null Primary key,
    Patients_ID int identity not null references Patients(Patients_ID),
    Medicine_name varchar(50) not null,
    Medicine_type varchar(50) not null,
    Medicine_manufacture varchar(100) not null,
    Medicine_expiry date not null,
    Medicine_mDate date not null,
    Medicine_price float not null
);

-----

● CREATE table E_P_Association
(
    emp_pat_ID int identity not null primary key,
    Employee_ID int not null references Employee(Employee_ID),
    Patients_ID int not null references Patients(Patients_ID)
);

-----

● CREATE table Departments
(
    Department_ID int not null primary key,
    Department_type varchar(60) not null,
    Department_name varchar(100) not null,
    Department_location varchar(100) not null
);

-----

● CREATE table E_D_Association
(
    Emp_Dept_ID int not null primary key,
    Employee_ID int not null references Employee(Employee_ID),
    Department_ID int not null references Departments(Department_ID)
);

-----

● CREATE table Online_Services
(
    Patients_ID int not null references Patients(Patients_ID),
    Services varchar(200) not null
);
```

Raw Data

PATIENTS (1)

Patients_ID	Patients_first_name	Patient_last_name	Patient_street_no	Patient_City	Patients_Zipcode	Patients_gender	Patients_contact No.	Patients_DOB	Patients_symptoms	Patients_pre-existing ailments
2001	Bill	Keats	31 Saint Lukes	Allston	2134	M	8567263551	2/3/98	Fever, Cold	NA
2002	Joe	Smith	42 B Dorchester	Boston	2110	F	6377265451	4/4/87	Severe Chills	Diabetes

2025	Shekar	Sawant	34 Harvard Road	Cambridge	2210	N	3756265645	6/18/56	Covid	Diabetes

We used Dbeaver to import data in CSV Format.*

- A major challenge of data creation was to ensure that the tables are referenced correctly and making sure all the relations between the entities have been identified and connected accurately.
- Using the two tables E_D_Association and E_P_Association we were able to successfully create references between the tables and make sure that all the primary keys and foreign keys are correctly marked.
- Key points to keep in mind:
 1. Make sure that the data types match in the ERD and the database code.
 2. Check for null values of the attributes for each entity.
 3. Make sure that the rows are identified and connected properly by joining columns of the table on the right one.
 4. Please check all constraints are have been kept in mind while creating the database.

Functions

1. **Tax function**
2. **Visitors function**
3. **Medicine order function**
4. **Employee order function**
5. **Price check function**
6. **Age validation function**
7. **Age calculate function**
8. **Feedback function**
9. **Phone number validation function**

Functions

1. Tax function

Calculated sale tax based on the price in Medine table.
the tax rate is defined to be 0.06

```
CREATE FUNCTION dbo.tax(@price float)
```

2. Visitors function

Compute columns of number of visitors for each patient.

```
CREATE FUNCTION dbo.NumOfPatients(@patientid INT)
```

Functions

3. Medicine order function

Compute columns for number of medicine orders for each patient.

```
CREATE FUNCTION dbo.NumOfMed(@patientid INT)
```

4. Employee order function

Compute columns for number of employees in each department.

```
CREATE FUNCTION dbo.NumOfEmp(@eID INT)
```

Functions

5.Price check

To check if the price of the medicine is valid.

```
CREATE FUNCTION dbo.price_check(@price float)
```

6.Age validation function(with constraint)

Check if the age is a valid age(0-200)

```
CREATE FUNCTION dbo.age_check(@age INT)
```

Constraint

```
ADD CONSTRAINT Age_Valid CHECK (dbo.age_check(Visitors_age)=1);
```

Functions

7.Age calculate function

Calculated age of the patient based on patient's DOB.

```
CREATE FUNCTION dbo.abcd (@Patients_ID INT)
```

8.Feedback function

Action on feedback

```
CREATE FUNCTION dbo.fb (@PatientsID INT)
```

9.Phone number validation function

Check if the phone number is valid for 10 digits

```
CREATE FUNCTION dbo.PhNo(@phno int)
```

View 1 - Tax for medicine sales(with constraint)

This view computed a column named "sale_tax" based on the "Price" in the Medicine Table, and we assume the tax rate is 0.06.

Table level check constraint on medicine price

```
CREATE VIEW Medicine_v_2 AS  
ALTER TABLE Medicine  
ADD CONSTRAINT Price_Valid CHECK (dbo.price_check(Medicine_Price)=1);
```

	Patients_ID	Medicine_name	Medicine_type	Medicine_manufacture	Medicine_expiry	Medicine_mDate	Medicine_price	Sale_Tax
1	01	2,001 Crocin	Tablet	Cipla	2025-12-13	2022-11-12	10	0.6

11	11	2,010 Aspirin	Tablet	Takeda	2025-04-04	2021-09-27	10	0.6

View2-Total expense per patient

This view shows a total bill of medicines expenses for each patient.

```
CREATE VIEW Patient_Expense_V AS
SELECT P.Patients_ID, P.Patients_first_Name, SUM(M.Medicine_price) AS Total_Expense
FROM Patients AS P, Medicine AS M
WHERE P.Patients_ID = M.Patients_ID
GROUP BY Patients_first_Name, P.Patients_ID
```

123 Patients_ID	ABC Patients_first_Name	123 Total_Expense
2,001	Bill	116
2,002	Joe	87
2,003	Adam	69
2,004	Kelly	52
2,005	Shiva	41
2,007	Shreyas	8
2,008	Jeeva	14

View3-Employees number display

This view shows numbers of employees in each department associated with location id.

```
CREATE VIEW NumberOfEmployeees AS
```

	123 LocationID 	123 Number of Employees 
1	2,414	1
2	2,419	1
3	2,530	1
4	2,583	1
5	2,593	1
6	2,629	1
7	2,771	1
8	2,787	1
9	2,816	1
20	2,825	1

View4-Ambulance assign

This view shows information on the ambulance assign to employees on duty

```
CREATE VIEW EmployeeAmbulanceDat AS
```

	123 Employee ID	ABC First Name	ABC Last Name	ABC Ambulance Number	ABC Ambulance Availability
1	1,009	V	Taehyung	1	No
2	1,010	Chad	Pitt	4	No

Triggers

SQL codes that are automatically executed in response to any event on a particular Table.

1. Patient have bill amount over \$50,000 has a 10% discount.

```
CREATE Trigger Pat_discount ON dbo.bill  
AFTER INSERT, UPDATE |
```

2. Employee availability for an ambulance assign.

```
CREATE TRIGGER dbo.Statu ON dbo.Ambulance_Data  
AFTER INSERT, UPDATE
```

3. Date and time display for delivery of medicine after value inserted.

```
CREATE TRIGGER dbo.FillDelDate ON dbo.Deliveries  
AFTER INSERT, UPDATE
```

Stored Procedures

The Stored Procedures in our database

- ALLPATIENTS
- AvailableAmbulance
- InsertEmployee
- InsertPatient
- VIEWCOVID
- VIEWVISITORS
- VIEWEMPLOYEES
- VIEWPATIENTS

```
● CREATE PROCEDURE VIEWEMPLOYEES
AS

       v.Visitors_Lastname, p.Patients_first_Name,
       p.Patient_last_name
FROM PROJECTTEAM7.dbo.Visitors v
join PROJECTTEAM7.dbo.Patients p
on v.Patients_ID = p.Patients_ID
go;

EXEC VIEWVISITORS

-----

● CREATE PROCEDURE InsertPatient @ID int, @Fname varchar(60), @lname varchar(50),
                                @gender varchar(10), @dob date, @p_symp varchar(200), @cno varchar(20), @zip int,
                                @pstno varchar(200), @pcity varchar(50), @ppea varchar(200)
AS
BEGIN
    INSERT INTO PROJECTTEAM7.dbo.Patients ( Patients_ID, Patients_first_Name,
                                             Patient_last_name, Patients_gender,
                                             Patients_DOB, Patients_Symptoms, Contact_number,
                                             Patients_Zipcode, Patient_street_no,
                                             Patient_City, Patients_pre_existing_ailments )
    VALUES ( @ID, @Fname, @lname, @gender, @dob, @p_symp, @cno,
              @zip, @pstno, @pcity, @ppea )
end

EXEC InsertPatient(:@ID, :@Fname, :@lname, :@gender, :@dob, :@p_symp, :@cno, :@zip, :@pstno, :@pcity, :@ppea)
```

Column Level Encryption

We use the following steps for column level Encryption

1. Create a database Master Key
2. Create a self- signed certificate
3. Config symmetric key
4. Encrypt the Data
5. Query and Verify Encryption

```
➤ CREATE MASTER KEY ENCRYPTION BY  
PASSWORD = 'ProjectTeam7';
```

```
➤ CREATE CERTIFICATE Hospital  
WITH SUBJECT = 'Hospital Data Security';
```

```
➤ CREATE SYMMETRIC KEY H_key  
WITH ALGORITHM = AES_256  
ENCRYPTION BY CERTIFICATE Hospital;
```

```
UPDATE PROJECTTEAM7.dbo.Patients  
SET EncryptedCNO = EncryptByKey(Key_GUID('H_key'), Contact_number);
```

```
SELECT p.Contact_number , EncryptedCNO  
AS 'Encrypted Contact Number',  
CONVERT(nvarchar, DecryptByKey(EncryptedCNO))  
AS 'Decrypted Contact Number'  
FROM Patients p ;
```
